Eucalyptus sinuosa

octopus mallee

subg. Symphyomyrtus

sect. Glandulosae ser. Lehmannianae subser. Conjunctae

Notes: A distinctive species due to its very long, curved

The species is most closely related to *E. mcquoidii* (Quoin Head marlock), which is known from the Quoin Head area

in Fitzgerald River NP. Eucalyptus mcquoidii is distinguished

from E. sinuosa by being non-lignotuberous (it is an obligate

seeder), and its generally shorter (though still long, 50-

Eucalyptus sinuosa has in the past been confused with

E. lehmannii (bushy yate, with two subspecies), which is a

much more common species, occurring from the Stirling Range eastwards to Cape Arid. It differs from *E. sinuosa* in

its flattened peduncles, its broader adult leaves (8-27 mm

wide) that lack the marginal lenticels, and its shorter, straight

Conservation Status: Most populations are conserved in

IUCN Red List: Least Concern (2024).

EPBC Act 1999: Not listed (2024).

BC Act 2016: Not listed (2024).

DBCA: Priority 2 (2024).

State (WA):

opercula (bud caps), which are the longest of any eucalypt.

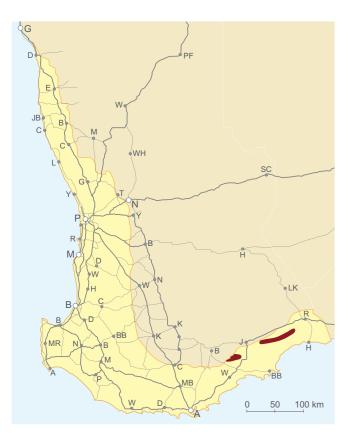

Name: From the Latin *sinuosus* (sinuate or winding), referring to the distinctive opercula of its flower buds. The common name refers to the octopus-like appearance of the flower buds.

Authority: *Eucalyptus sinuosa* D.Nicolle, M.E.French & McQuoid, Nuytsia 18: 209 (2008). Type: Peniup NR, southwest of Jerramungup, WA, 7 Jan 2007, D.Nicolle 5061 & M.E.French (holo: PERTH; iso: AD, CANB).

Key features: Bushy, multi-stemmed mallee, lignotuber resprouter. Bark smooth. Adult leaves narrow, with blackened lenticels on the leaf margins. Flower clusters on long stalks. Bud bases fused together. Bud caps extremely long, curved, often bulbous at tip. Flowers yellow-green, grouped in large 'balls'. Fruits fused into large groups, with valves strongly exserted (forming 'spiky balls').

Distribution & Habitat: Endemic to the south-west region.

Known from scattered populations near the south coast, from the Corackerup Creek catchment (south-east of Ongerup) eastwards to the lower West River catchment in Fitzgerald River NP. Although the known populations are well scattered, the species is usually locally common or dominant where it occurs. It grows in white granitic sand or gravel on slight slopes or in undulating topography in mallee shrubland. Associated eucalypts include *E. austrina*, *E. conglobata* subsp. perata, *E. pleurocarpa*, *E. sporadica*, *E. uncinata* subsp. uncinata and *E. xanthonema*.
